

PROJECT DESIGN PHASE

PROPOSED SOLUTION & PROJECT DOCUMENTATION

Date	03 October 2026
Team ID	SW TID- 2026- 6497
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

1. Proposed Solution Template

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Organizations often receive employee information in Excel or spreadsheet format. Manually entering a large number of records into ServiceNow is time-consuming and can result in missing values, incorrect field mapping and duplicate records. The project addresses this problem by providing a structured bulk data-import process.
2	Idea / Solution description	The solution uses ServiceNow Import Sets and Transform Maps to import employee data from a spreadsheet. The spreadsheet data is first loaded into an Import Set Table, which acts as a staging area. A Transform Map then maps source fields to the appropriate target table fields. The data is transformed, validated and checked for duplicates using Coalesce where required. Reports and

3	Novelty / Uniqueness	dashboards are used to verify the final records.
5	Business Model (Revenue Model)	The solution can be offered as part of ServiceNow implementation and data-migration services. Organizations can use the workflow for configuration, bulk migration, customization, maintenance and administrator training. The same approach can be extended to different departments and business datasets.
6	Scalability of the Solution	The solution can be extended from small spreadsheets to large datasets and can be reused with different ServiceNow target tables. Future enhancements can include scheduled imports, multiple data sources, automated validation, notifications, REST/API-based imports and advanced dashboards.

2. Project Overview

Import Data using Transform Maps (Spreadsheet) is a ServiceNow micro project that demonstrates the complete process of importing structured employee data from an external spreadsheet into ServiceNow. The project uses an Import Set Table as a temporary staging area and a Transform Map to control the movement of source data into the target ServiceNow table.

3. Project Objective

To import employee data from an Excel/spreadsheet file into ServiceNow.

To create an Import Set Table for staging source data.

To create a Transform Map for source- to- target field mapping.

To transform and validate the imported records.

To use Coalesce where appropriate to reduce duplicate records.

To verify the imported data using reports and dashboard views.

4. Technologies and Tools

ServiceNow platform

Import Sets

Transform Maps

Import Set Table

Coalesce

ServiceNow Reports and Dashboards

Excel / Spreadsheet file as the source data

5. Proposed System Workflow

Stage	Activity	Description
Step 1	Prepare Spreadsheet	Create structured employee data with fields such as Employee ID, Name, Email, Department and Location.
Step 2	Create Import Set Table	Create/load a staging table to temporarily store the spreadsheet data.
Step 3	Load Data	Upload the spreadsheet through the ServiceNow import process.

Step 4	Create Transform Map	Connect the Import Set Table to the required target table.
Step 5	Map Fields	Map each source field to its corresponding target field.
Step 6	Configure Coalesce	Use a unique field such as Employee ID when duplicate checking is required.
Step 7	Transform Data	Run the transform to create or update records in the target table.
Step 8	Validate Results	Review imported records, transform results and any errors.
Step 9	Reports/Dashboard	Create reports or dashboard views to verify the imported data.

6. Sample Source Data

Employee ID	Employee Name	Email	Department	Location
EMP001	Arun Kumar	arun@example.com	IT	Chennai
EMP002	Priya S	priya@example.com	HR	Coimbatore
EMP003	Kavin R	kavin@example.com	Finance	Bengaluru

7. Import Set and Transform Map

The Import Set Table receives the raw spreadsheet data before it is transferred to the final target table. The Transform Map defines how each source field should be mapped to the target field. During transformation, ServiceNow processes the imported rows and creates or updates target records according to the configured mappings and rules.

8. Duplicate Prevention

Coalesce can be configured on a field that uniquely identifies an employee, such as Employee ID. This allows the transform process to identify an existing record and update it instead of creating another record with the same unique identifier.

9. Validation and Testing

Verify that the spreadsheet is uploaded successfully.

Verify that all expected rows appear in the Import Set Table.

Verify that source fields are mapped to the correct target fields.

Check that valid records are created or updated after transformation.

Test duplicate Employee IDs and verify the configured Coalesce behavior.

Review transform errors and correct invalid data where necessary.

Verify the final records through list views and reports.

10. Expected Result

After successful execution, employee information from the spreadsheet is available as structured records in the ServiceNow target table. The transformation process reduces manual entry, maintains consistent field mapping and supports duplicate checking. Reports and dashboards provide a convenient way to verify the imported records.

11. Milestones

Milestone	Title	Work Description
Milestone 1	Creation of Spreadsheet and Table	Prepare sample employee spreadsheet and create the required staging/target table.
Milestone 2	Creation of Import Set Table and Transform Map	Load spreadsheet data and configure source-to-target field mappings.
Milestone 3	Transform Data, Validate and Enable Coalesce	Run the transformation, check results/errors and configure duplicate prevention.
Milestone 4	Creation of Reports and Dashboards	Create simple reports/dashboard views to verify and present imported data.

12. Benefits

Reduces manual data- entry effort.

Supports bulk data migration.

Provides controlled field mapping.

Helps identify and reduce duplicate records.

Makes data validation easier.

Provides reusable knowledge for future ServiceNow imports.

13. Future Enhancements

Scheduled automatic imports.

Integration with REST APIs and other external data sources.

Automated data- quality validation.

Email notifications for import failures or completion.

Multiple Transform Maps for different departments.

Advanced dashboards for import monitoring.

14. Conclusion

This project demonstrates a practical ServiceNow data-import workflow using Import Sets and Transform Maps. It provides a systematic way to move spreadsheet data into ServiceNow, map fields correctly, validate records and reduce duplicate creation. The workflow can also serve as a foundation for larger ServiceNow data- migration and integration projects.
