Solution Fit Documentation

Import Data using Transform Maps (Spreadsheet)

Date	03.10.2026
Team ID	SW TID- 2026- 6497
Project Name	Import Data using Transform Maps (Spreadsheet)
Category	Information Technology / Group Project
Maximum Marks	2 Marks

1. Project Overview

This micro project focuses on importing structured data from an external spreadsheet into the ServiceNow platform using Import Sets and Transform Maps. The project represents a real-world scenario in which bulk employee data is received in Excel format and must be migrated into ServiceNow efficiently and accurately.

The spreadsheet data is first loaded into an Import Set table, which acts as a staging area. A Transform Map is then configured to map source fields to the appropriate target table fields. After the transformation is executed, records are created in the target table and validated to ensure data integrity.

2. Problem Identification

Organizations may receive employee or other structured data in spreadsheet format that needs to be transferred into ServiceNow. Manual entry of large amounts of data can be time-consuming and may introduce mapping errors, duplicate records, or inconsistent information.

Bulk spreadsheet data needs to be migrated into ServiceNow.

Manual record creation is inefficient for large datasets.

Source spreadsheet fields must be correctly matched with target table fields.

Imported records need validation to maintain data accuracy and integrity.

Duplicate records should be avoided during the import process.

3. Target Users / Customer Context

The project is intended for ServiceNow users, administrators, and teams that

need to move structured spreadsheet data into ServiceNow. It is also relevant to beginners learning the end- to- end data import process.

4. Proposed Solution

The proposed solution uses ServiceNow Import Sets and Transform Maps to create a controlled data-import workflow. Spreadsheet data is loaded into an Import Set table, source fields are mapped to target fields through a Transform Map, and the transformation is executed to create records in the target table.

1. Create and prepare the source spreadsheet.
2. Load the spreadsheet data into an Import Set table.
3. Configure a Transform Map to map source fields to target fields.
4. Transform the imported data into the target table.
5. Use coalesce to help avoid duplicate records where applicable.
6. Validate the transformed records.
7. Create reports and dashboards to review the imported data.

5. Problem- Solution Fit

Customer Problem	ServiceNow Solution	Expected Fit
Large amount of spreadsheet data	Import Set for bulk loading	Reduces manual data entry
Incorrect field matching	Transform Map field mapping	Creates structured source-to-target mapping
Duplicate records	Coalesce during transformation	Helps prevent duplicate target records
Need to verify imported data	Validation and reports	Supports checking data integrity

The project description shown in SkillWallet connects the identified data-migration problem with the proposed Import Set, Transform Map, transformation, validation, coalesce, reporting, and dashboard workflow.

6. SkillWallet Project Evidence

The provided screenshot shows the SkillWallet group project page for "Import Data using Transform Maps (Spreadsheet)." It displays the project description, ServiceNow skill, team- member section, and four project milestones.

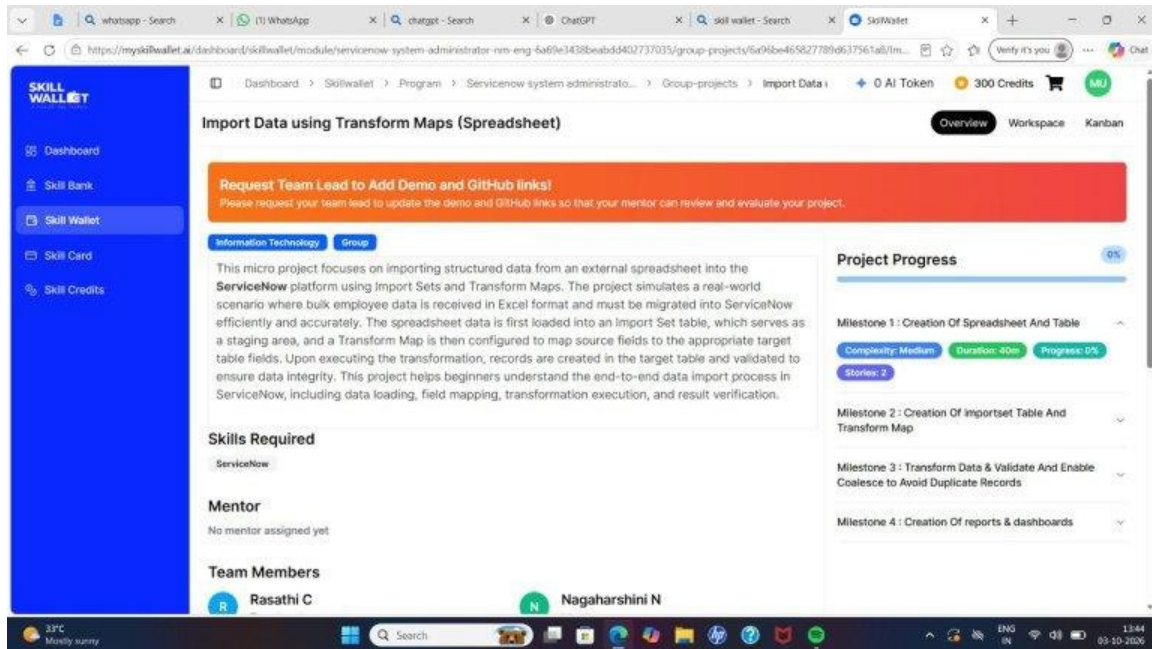

Figure 1. SkillWallet project overview and milestones

7. Project Milestones

Milestone	Activity	Purpose
Milestone 1	Creation of Spreadsheet and Table	Create the spreadsheet and required table structure.
Milestone 2	Creation of Import Set Table and Transform Map	Configure the staging table and field mappings.
Milestone 3	Transform Data, Validate and Enable Coalesce	Transform records, validate results, and use coalesce to avoid duplicates.
Milestone 4	Creation of Reports & Dashboards	Present and review the imported data through reports and dashboards.

8. Team Information Visible in Screenshot

The screenshot visibly shows the team members Rasathi C and Nagaharshini N. The complete team-member list and Team ID are not visible in the provided image, so no additional names or identifiers have been added.

9. Conclusion

The Problem-Solution Fit for this project is based on a clear relationship between the need to move structured spreadsheet data into ServiceNow and the use of Import Sets, Transform Maps, validation, coalesce, reports, and dashboards. The project demonstrates an end-to-end approach to structured data migration within the ServiceNow environment.
